FUNCTION

1. CARTESIAN PRODUCT OF TWO SETS :

Given two non-empty sets A and B. The cartesian product $A \times B$ is the set of all ordered pairs of the form (a, b) where the first entry comes from set A & second comes from set B.

$A \times B = \{(a, b) \mid a \in A, b \in B\}$

e.g. $A = \{1, 2, 3\}$ $\quad$ $B = \{p, q\}$

$A \times B = \{(1, p), (1, q), (2, p), (2, q), (3, p), (3, q)\}$

Note :

(i) If either A or B is the null set, then $A \times B$ will also be empty set, i.e. $A \times B = \phi$

(ii) If $n(A) = p, n(B) = q$, then $n(A \times B) = pq$, where n(X) denotes the number of elements in set X.

(iii) A **Relation** R from set A to B is any subset of $A \times B$. If $A\,R\,B$ & $(a, b) \in R$ then b is image of a under R and a is preimage of b under R.

Note : If n(A) = m, n(B) = n, then number of relations defined from set A to B are 2^{mn}.

2. FUNCTION :

A relation R from set A to set B is called a function if each element of A is uniquely associated with some element of B. It is denoted by the symbol :

$$f : A \to B \text{ or } A \xrightarrow{f} B$$

which reads 'f' is a function from A to B 'or' f maps A to B,

If an element $a \in A$ is associated with an element $b \in B$, then b is called 'the f image of a' or 'image of a under f' or 'the value of the function f at a'. Also a is called the 'pre-image of b' or 'argument of b under the function f'. We write it as

$b = f(a)$ or $f : a \to b$ or $f : (a, b)$

Thus a function 'f' from set A to set B is subset of $A \times B$ in which each a belonging to A appears in one and only one ordered pair belonging to f.

Representation of Function :

(a) Ordered pair : Every function from $A \to B$ satisfies the following conditions :

(i) $f \subset A \times B$ (ii) $\forall\ a \in A$ there exist $b \in B$ and (iii) $(a, b) \in f$ & $(a, c) \in f \Rightarrow b = c$

(b) Formula based (uniformly/nonuniformly) :

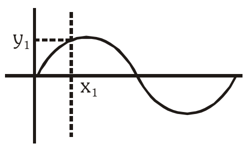
(i) $f : \mathbb{R} \to \mathbb{R}, y = f(x) = 4x$, $f(x) = x^2$ (uniformly defined)

(ii) $f(x) = \begin{cases} x+1 & -1 \le x < 4 \\ -x & 4 \le x < 7 \end{cases}$ (non-uniformly defined)

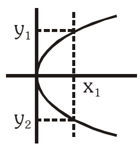
(iii) $f(x) = \begin{cases} x^2 & x \ge 0 \\ -x-1 & x < 0 \end{cases}$ (non-uniformly defined)

(c) Graphical representation :

If a vertical line cuts a given graph at more than one point then it can not be the graph of a function.



Graph (1)



Graph (2)

Graph(1) represent a function but graph(2) does not represent a function.

Every function is a relation but every relation is not necessarily a function.

3. DOMAIN, CO-DOMAIN & RANGE OF A FUNCTION :

Let $f: A \to B$, then the set A is known as the domain of f & the set B is known as co-domain of f. The set of f images of all the elements of A is known as the range of f.

Domain of $f = \{a \mid a \in A, (a, f(a)) \in f\}$

Range of $f = \{f(a) \mid a \in A, f(a) \in B\}$

(a) If only the rule of function is given then the domain of the function is the set of those real numbers, where function is defined.

(b) For a continuous function, the interval from minimum to maximum value of a function gives the range

(c) It should be noted that range is a subset of co-domain.

Note :

(i) The complete set of all positive real numbers is denoted by $\mathbb{R}^+$ or $\mathbb{R}_{>0}$

(ii) The complete set of all negative real numbers is denoted by $\mathbb{R}^-$ or $\mathbb{R}_{<0}$

(iii) The complete set of all real numbers other then zero is denoted by $\mathbb{R}^*$ or $\mathbb{R}_{\neq 0}$

(iv) The complete set of all integers is denoted by $\mathbb{Z}$.

Illustration 1 : Find the domain of following functions :

(i) $y = \sqrt{5-2x}$ (ii) $y = \dfrac{1}{\sqrt{x-|x|}}$

Solution : (i) $5 - 2x \geq 0 \Rightarrow x \leq \dfrac{5}{2}$ $\therefore$ Domain is $(-\infty, 5/2]$

(ii) $x - |x| > 0 \Rightarrow |x| < x \Rightarrow$ x cannot take any real values $\therefore$ Domain is ϕ

Illustration 2 : Find the range of following functions :

(i) $f(x) = \log_{\sqrt{2}}\left((x-1)^2+4\right)$ (ii) $f(x) = 3 - \cos x$

Solution : (i) $f(x) = \log_{\sqrt{2}}\left((x-1)^2+4\right)$

$4 \leq (x-1)^2 + 4 < \infty$

$\Rightarrow \log_{\sqrt{2}} 4 \leq \log_{\sqrt{2}}(x-1)^2 + 4 < \infty$

$\Rightarrow 4 \leq \log_{\sqrt{2}}(x-1)^2 + 4 < \infty$

$\therefore$ Range of $f(x) = [4,\infty)$

(ii) $f(x) = 3 - \cos x$

$-1 \leq \cos x \leq 1$

$2 \leq 3 - \cos x \leq 4$

$\therefore$ Range of $f(x) = [2,4]$

(i) Find the domain of following functions :

(a) $y = 1 - \log_{10}x$ (b) $y = \dfrac{1}{\sqrt{x^2-4x}}$

(ii) Find the range of the following function :

(a) $\log_4\left|x + \dfrac{1}{x}\right|$ (b) $f(x) = \sin(3x^2 + 1)$

(c) $f(x) = 2\sin\left(2x + \dfrac{\pi}{4}\right)$ (d) $f(x) = \cos\left(2x + \dfrac{\pi}{4}\right)$

4. IMPORTANT TYPES OF FUNCTIONS :

(a) Polynomial Function :

If a function f is defined by $f(x) = a_0 x^n + a_1 x^{n-1} + a_2 x^{n-2} + ... + a_{n-1} x + a_n$ where n is a non negative integer and $a_0, a_1, a_2, ..., a_n$ are real numbers and $a_0 \neq 0$, then f is called a polynomial function of degree n. If n is odd, then polynomial is of odd degree, if n is even, then polynomial is of even degree.

Note :

(i) Range of odd degree polynomial is always $\mathbb{R}$.

(ii) Range of even degree polynomial is never $\mathbb{R}$.

(iii) A polynomial of degree one with no constant term is called an odd linear function. i.e. $f(x) = ax$, $a \neq 0$

(iv) $f(x) = ax + b$, $a \neq 0$ is a linear polynomial

(v) $f(x) = c$ is non linear polynomial (its degree is zero)

(vi) $f(x) = 0$ is a polynomial but its degree is **not** defined

(vii) There are four polynomial functions, satisfying the relation ;
$f(x) \cdot f(1/x) = f(x) + f(1/x)$. They are : (a) $f(x) = 0$ (b) $f(x) = 2$
(c) $f(x) = x^n + 1$ & (d) $f(x) = 1 - x^n$, where n is a positive integer.

(b) Algebraic Function :

y is an algebraic function of x, if it is a function that satisfies an algebraic equation of the form $P_0(x)\, y^n + P_1(x)\, y^{n-1} + ... + P_{n-1}(x)\, y + P_n(x) = 0$. Where n is a positive integer and $P_0(x)$, $P_1(x)$....... are Polynomials in x. e.g. $x^3 + y^3 - 3xy = 0$.

In other words a function 'f' is called an algebraic function if it can be constructed using finite number of algebraic operations (such as addition, subtraction, multiplication, division, and taking radicals) within polynomials.

Example : $f(x) = \sqrt{x^2+1}$; $g(x) = \dfrac{x^4 - 16x^2}{x + \sqrt{x}} + (x-2)\sqrt[3]{x+1}$

Note :

(i) All polynomial functions are Algebraic but not the converse.

(ii) A function that is not algebraic is called **Transcendental Function.**

(e) Exponential and Logarithmic Function :

A function $f(x) = a^x (a > 0)$, $a \neq 1$, $x \in \mathbb{R}$ is called an exponential function. The inverse of the exponential function is called the logarithmic function, i.e. $g(x) = \log_a x$.

Note that f(x) & g(x) are inverse of each other & their graphs are as shown. (If functions are mirror image of each other about the line y = x)

Domain of a^x is $\mathbb{R}$ **Range** $\mathbb{R}^+$

Domain of $\log_a x$ is $\mathbb{R}^+$ **Range** $\mathbb{R}$

It is also written as $\text{Sgn } x = |x|/x\ ;\ x \neq 0\ ;$

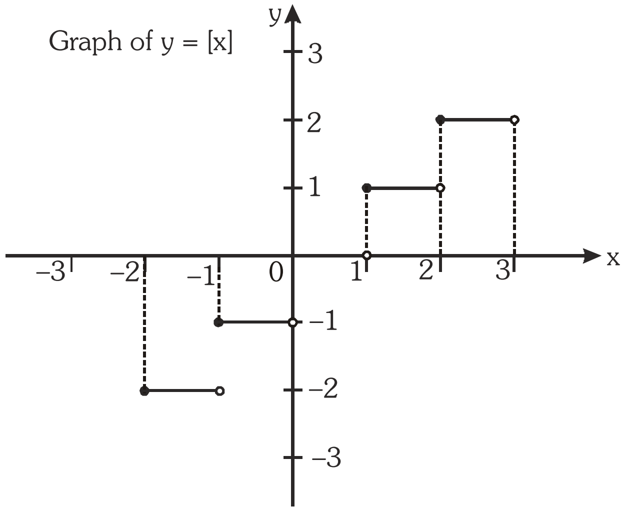
(h) Greatest integer or step up function :

The function $y = f(x) = [x]$ is called the greatest integer function where $[x]$ denotes the greatest integer less than or equal to x. Note that for :

x	[x]
[–2,–1)	–2
[–1,0)	–1
[0,1)	0
[1,2)	1



Domain : $\mathbb{R}$

Range : I

Properties of greatest integer function :

(i) $[x] \le x < [x] + 1$ and $x - 1 < [x] \le x$, $0 \le x - [x] < 1$

(ii) $[x + m] = [x] + m$, if m is an integer.

(iii) $[x] + [-x] = \begin{cases} 0, & x \in I \\ -1, & x \notin I \end{cases}$

Illustration 3 : If $y = 2[x] + 3$ & $y = 3[x - 2] + 5$, then find $[x + y]$ where [.] denotes greatest integer function.

Solution : $y = 3[x - 2] + 5 = 3[x] - 1$

so $3[x] - 1 = 2[x] + 3$

$[x] = 4 \Rightarrow 4 \le x < 5$

then $y = 11$

so $x + y$ will lie in the interval $[15, 16)$

so $[x + y] = 15$

Illustration 4 : Find the value of $\left[\frac{1}{2}\right]+\left[\frac{1}{2}+\frac{1}{1000}\right]+......\left[\frac{1}{2}+\frac{2946}{1000}\right]$ where [.] denotes greatest integer function ?

Solution :

$$\left[\frac{1}{2}\right]+\left[\frac{1}{2}+\frac{1}{1000}\right]+......\left[\frac{1}{2}+\frac{499}{1000}\right]+\left[\frac{1}{2}+\frac{500}{1000}\right]+......\left[\frac{1}{2}+\frac{1499}{1000}\right]+\left[\frac{1}{2}+\frac{1500}{1000}\right]+......$$

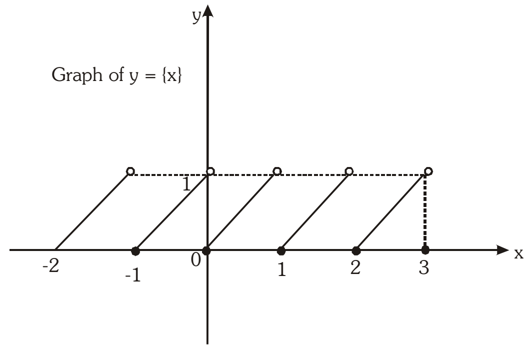
$$+\left[\frac{1}{2}+\frac{2499}{1000}\right]+\left[\frac{1}{2}+\frac{2500}{1000}\right]+......\left[\frac{1}{2}+\frac{2946}{1000}\right]$$

$= 0 + 1 \times 1000 + 2 \times 1000 + 3 \times 447 = 3000 + 1341 = 4341$ **Ans.**

(i) Fractional part function :

It is defined as : g(x) = {x} = x – [x]

e.g. the fractional part of the number 2.1 is 2.1–2 = 0.1 and the fractional part of –3.7 is 0.3 The period of this function is 1 and graph of this function is as shown.



x	{x}
[–2,–1)	x+2
[–1,0)	x+1
[0,1)	x
[1,2)	x–1

Domain : $\mathbb{R}$

Range : [0,1)

Properties of fractional part function :

(i) $0 \le \{x\} < 1$ (ii) $\{[x]\} = [\{x\}] = 0$ (iii) $\{\{x\}\} = \{x\}$

(iv) $\{x+m\} = \{x\},\ m \in I$ (v) $\{x\} + \{-x\} = \begin{cases} 1, & x \notin I \\ 0, & x \in I \end{cases}$

Illustration 5 : Solve the equation $|2x-1| = 3[x] + 2\{x\}$ where [.] denotes greatest integer and {.} denotes fractional part function.

Solution : We are given that, $|2x-1| = 3[x] + 2\{x\}$

Let, $2x - 1 \le 0$ i.e. $x \le \frac{1}{2}$. The given equation yields.

$1 - 2x = 3[x] + 2\{x\}$

$\Rightarrow\ 1 - 2[x] - 2\{x\} = 3[x] + 2\{x\} \Rightarrow\ 1 - 5[x] = 4\{x\} \Rightarrow \{x\} = \frac{1-5[x]}{4}$

$\Rightarrow\ 0 \le \frac{1-5[x]}{4} < 1 \Rightarrow 0 \le 1 - 5[x] < 4 \Rightarrow -\frac{3}{5} < [x] \le \frac{1}{5}$

Now, [x] = 0 as zero is the only integer lying between $-\frac{3}{5}$ and $\frac{1}{5}$

$\Rightarrow\ \{x\} = \frac{1}{4} \Rightarrow x = \frac{1}{4}$ which is less than $\frac{1}{2}$, Hence $\frac{1}{4}$ is one solution.

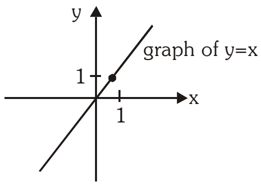
Now, let $2x - 1 > 0$ i.e $x > \frac{1}{2}$

$\Rightarrow\ 2x - 1 = 3[x] + 2\{x\}\ \Rightarrow\ 2[x] + 2\{x\} - 1 = 3[x] + 2\{x\}$

$\Rightarrow\ [x] = -1 \Rightarrow -1 \le x < 0$ which is not a solution as $x > \frac{1}{2}$

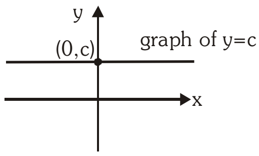
$\Rightarrow\ x = \frac{1}{4}$ is the only solution.

(j) Identity function :



The function $f: A \rightarrow A$ defined by $f(x) = x \ \forall \ x \in A$ is called the identity of A and is denoted by I_A. It is easy to observe that identity function defined on R is a bijection.

(k) Constant function :



A function $f: A \rightarrow B$ is said to be a constant function if every element of A has the same f image in B. Thus $f: A \rightarrow B$; $f(x) = c, \ \forall \ x \in A, \ c \in B$ is a constant function. Note that the range of a constant function is a singleton.

(B)	$[x]^2 - 5[x] + 6 = 0$	(q)	$x \in (-\infty, -2] \cup [2, \infty)$
(C)	$x = \{x\}$	(r)	$x \in (-\infty, -5)$
(D)	$[x] < -5$	(s)	$x \in \{-2\}$
		(t)	$x \in [0, 1)$

5. ALGEBRAIC OPERATIONS ON FUNCTIONS :

(a) $(f \pm g)(x) = f(x) \pm g(x)$ domain in each case is $A \cap B$

(b) $(f.g)(x) = f(x).g(x)$ domain is $A \cap B$

(c) $\left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)}$ domain $A \cap B - \{x | g(x) = 0\}$

Illustration 6 : Find the domain of the following function :

Solution : (i) $y = \log_{(x-4)}(x^2 - 11x + 24)$

Here 'y' would assume real value if,

$x - 4 > 0$ and $\neq 1$, $x^2 - 11x + 24 > 0 \Rightarrow x > 4$ and $\neq 5$, $(x - 3)(x - 8) > 0$

$\Rightarrow x > 4$ and $\neq 5$, $x < 3$ or $x > 8 \Rightarrow x > 8 \Rightarrow$ Domain (y) = $(8, \infty)$

(ii) We have $f(x)=\log_2\left(-\log_{1/2}\left(1+\frac{1}{\sqrt[4]{x}}\right)-1\right)$

$f(x)$ is defined if $-\log_{1/2}\left(1+\frac{1}{\sqrt[4]{x}}\right)-1>0$

or if $\log_{1/2}\left(1+\frac{1}{\sqrt[4]{x}}\right)<-1$ or if $\left(1+\frac{1}{\sqrt[4]{x}}\right)>(1/2)^{-1}$

or if $1+\frac{1}{\sqrt[4]{x}}>2$ or if $\frac{1}{\sqrt[4]{x}}>1$ or if $x^{1/4}<1$ or if $0<x<1$

$\therefore$ D(f) = (0, 1)

Illustration 7 : Find the domain $f(x)=\frac{1}{\sqrt{\|[|x|-5]\|-11}}$ where [.] denotes greatest integer function.

Solution : $\|[|x|-5]\|>11$

so $[|x|-5]>11$ or $[|x|-5]<-11$

$[|x|]>16$ $\quad$ $[|x|]<-6$

$|x|\geq 17$ or $|x|<-6$ (Not Possible)

$\Rightarrow$ $x \leq -17$ or $x \geq 17$

so $x \in (-\infty, -17] \cup [17, \infty)$

(i) $f(x)=\frac{1}{8-3\sin x}$ (ii) $f(x)=\log_{\sqrt{2}}\left(2-\log_2(16\sin^2 x+1)\right)$

Solution : (i) $f(x)=\frac{1}{8-3\sin x}$

$-1 \leq \sin x \leq 1$

$\therefore$ Range of f = $\left[\frac{1}{11},\frac{1}{5}\right]$

(ii) $f(x)=\log_{\sqrt{2}}\left(2-\log_2(16\sin^2 x+1)\right)$

$1 \leq 16\sin^2 x + 1 \leq 17$

$\therefore$ $0 \leq \log_2(16\sin^2 x+1) \leq \log_2 17$

$\therefore$ $2-\log_2 17 \leq 2-\log_2(16\sin^2 x+1) \leq 2$

Now consider $0 < 2-\log_2(16\sin^2 x+1) \leq 2$

$\therefore$ $-\infty < \log_{\sqrt{2}}[2-\log_2(16\sin^2 x+1)] \leq \log_{\sqrt{2}} 2 = 2$

$\therefore$ the range is $(-\infty, 2]$

6. EQUAL OR IDENTICAL FUNCTION :

Two function f & g are said to be equal if :

(a) The domain of f = the domain of g

(b) The co-domain of f = co-domain of g and

(c) f(x) = g (x), for every x belonging to their common domain (i.e. should have the same graph)

7. HOMOGENEOUS FUNCTIONS :

A function is said to be homogeneous with respect to any set of variables when each of its terms is of the same degree with respect to those variables.

For examples $5x^2 + 3y^2 - xy$ is homogenous in x & y. Symbolically if, $f(tx, ty) = t^n f(x, y)$ then $f(x, y)$ is homogeneous function of degree n.

Solution : It is clear that (D) does not have the same degree in each term. **Ans. (D)**

8. BOUNDED FUNCTION :

A function is said to be bounded if there exists a finite M such that $|f(x)| \le M, \forall x \in D_f$.

9. IMPLICIT & EXPLICIT FUNCTION :

A function defined by an equation not solved for the dependent variable is called an **implicit function**. e.g. the equations $x^3 + y^3 = 1$ & $x^y = y^x$, defines y as an implicit function. If y has been expressed in terms of x alone then it is called an **Explicit function.**

(ii) Which of the following function is implicit function ?

(A) $xy - \cos(x + y) = 0$ (B) $y = x^3$

(C) $y = \log(x^2 + x + 1)$ (D) $y = |x|$

(a) $xy = 1$ (b) $x^2y = 1$.

10. APPLICATIONS OF FUNCTIONAL RULE :

Illustration 13 : Determine all functions f satisfying the functional relation.

$$f(x)+f\left(\frac{1}{1-x}\right)=\frac{2(1-2x)}{x(1-x)} \text{ where } x\in\mathbb{R}-\{0,1\}$$

Solution : Given $f(x)+f\left(\frac{1}{1-x}\right)=\frac{2(1-2x)}{x(1-x)}=\frac{2}{x}-\frac{2}{1-x}$ ...(i)

Replacing x by $\frac{1}{1-x}$ we obtain

$$f\left(\frac{1}{1-x}\right)+f\left(\frac{1}{1-\frac{1}{1-x}}\right)=2(1-x)-\frac{2}{1-\frac{1}{1-x}}$$

$$\Rightarrow f\left(\frac{1}{1-x}\right)+f\left(1-\frac{1}{x}\right)=-2x+\frac{2}{x} \quad \text{...(ii)}$$

Again replacing x by $\left(1-\frac{1}{x}\right)$ in (i) we obtain

$$\Rightarrow f\left(1-\frac{1}{x}\right)+f\left(\frac{1}{1-\left(1-\frac{1}{x}\right)}\right)=\frac{2}{1-\frac{1}{x}}-\frac{2}{1-\left(1-\frac{1}{x}\right)}$$

$$\Rightarrow f\left(1-\frac{1}{x}\right)+f(x)=\frac{2x}{x-1}-2x \quad \text{....(iii)}$$

subtracting (ii) from (i) then

$$f(x)-f\left(1-\frac{1}{x}\right)=2x-\frac{2}{1-x}$$

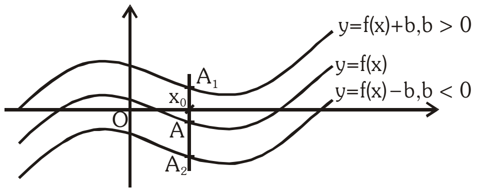
Now adding (iii) and (iv) we get

$$2f(x)=\frac{2x}{x-1}-\frac{2}{1-x}$$

$$\Rightarrow f(x)=\frac{x+1}{x-1}$$

11. BASIC TRANSFORMATIONS ON GRAPHS :

(i) Drawing the graph of $y = f(x) + b$, $b \in \mathbb{R}$, from the known graph of $y = f(x)$



It is obvious that domain of f(x) and f(x) + b are the same. Let us take any point x_0 in the domain of f(x). $y|_{x=x_0} = f(x_0)$.

The corresponding point on f(x) + b would be $f(x_0) + b$.

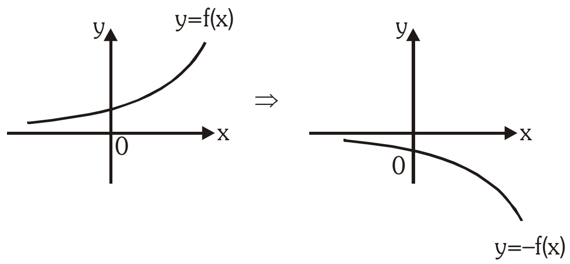
For $b > 0 \Rightarrow f(x_0) + b > f(x_0)$ it means that the corresponding point on f(x) + b would be lying at a distance 'b' units above the point on f(x).

For $b < 0 \Rightarrow f(x_0) + b < f(x_0)$ it means that the corresponding point on f(x) + b would be lying at a distance 'b' units below the point on f(x).

Accordingly the graph of f(x) + b can be obtained by translating the graph of f(x) either in the positive y-axis direction (if b > 0) or in the negative y-axis direction (if b < 0), through a distance $|b|$ units.

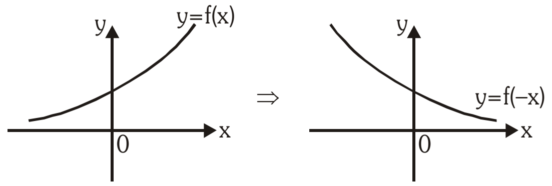
(ii) Drawing the graph of $y = -f(x)$ from the known graph of $y = f(x)$

To draw $y = -f(x)$, take the image of the curve $y = f(x)$ in the x-axis as plane mirror.



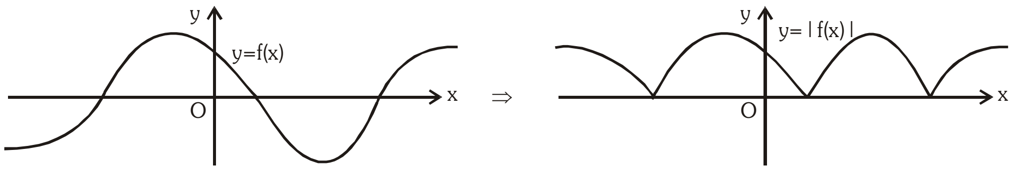
(iii) Drawing the graph of $y = f(-x)$ from the known graph of $y = f(x)$

To draw $y = f(-x)$, take the image of the curve $y = f(x)$ in the y-axis as plane mirror.



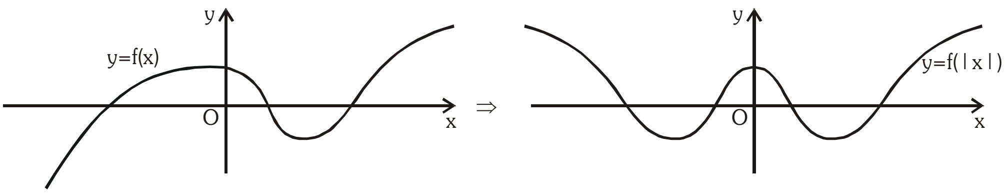
(iv) Drawing the graph of $y = |f(x)|$ from the known graph of $y = f(x)$

$|f(x)| = f(x)$ if $f(x) \geq 0$ and $|f(x)| = -f(x)$ if $f(x) < 0$. It means that the graph of f(x) and $|f(x)|$ would coincide if $f(x) \geq 0$ and for the portions where $f(x) < 0$ graph of $|f(x)|$ would be image of $y = f(x)$ in x-axis.



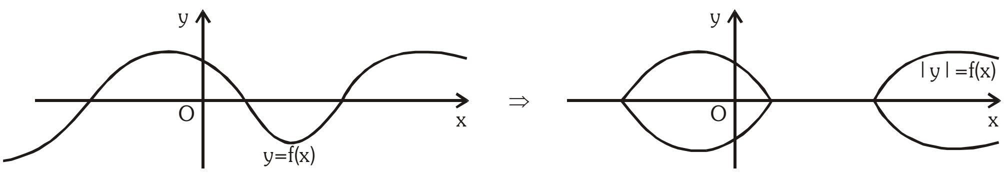
(v) Drawing the graph of y = f(|x|) from the known graph of y = f(x)

It is clear that, $f(|x|)=\begin{cases} f(x), & x \ge 0 \\ f(-x), & x<0 \end{cases}$. Thus f(|x|) would be a even function, graph of f(|x|) and f(x) would be identical in the first and the fourth quadrants (as $x \ge 0$) and as such the graph of f(|x|) would be symmetric about the y-axis (as (|x|) is even).

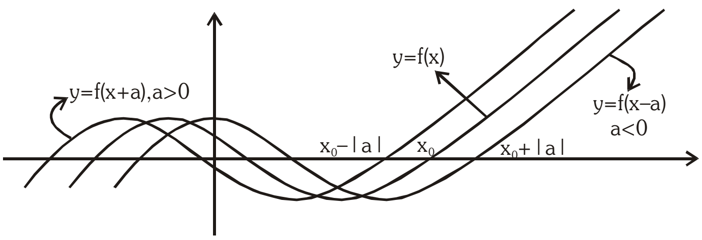


(vi) Drawing the graph of |y| = f(x) from the known graph of y = f(x)

Clearly $|y| \ge 0$. If $f(x) < 0$, graph of $|y| = f(x)$ would not exist. And if $f(x) \ge 0$, $|y| = f(x)$ would give $y = \pm f(x)$. Hence graph of $|y| = f(x)$ would exist only in the regions where f(x) is non-negative and will be reflected about the x-axis only in those regions.



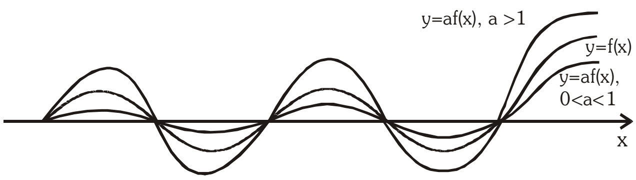
(vii) Drawing the graph of y = f(x + a), a ∈ ℝ from the known graph of y = f(x)



(i) If $a > 0$, shift the graph of f(x) through 'a' units towards left of f(x).

(ii) If $a < 0$, shift the graph of f(x) through 'a' units towards right of f(x).

(viii) Drawing the graph of y = af(x) from the known graph of y = f(x)



It is clear that the corresponding points (points with same x co-ordinates) would have their ordinates in the ratio of 1 : a.

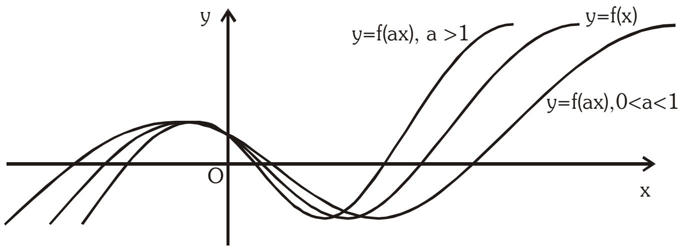
(ix) Drawing the graph of y = f(ax) from the known graph of y = f(x).



Let us take any point $x_0 \in$ domain of f(x). Let $ax = x_0$ or $x = \frac{x_0}{a}$.

Clearly if $0 < a < 1$, then $x > x_0$ and $f(x)$ will stretch by $\frac{1}{a}$ units along the y-axis and if $a > 1$, $x < x_0$, then f(x) will compress by 'a' units along the y-axis.

Note :

(i) A function h(x) is defined as

$h(x) = \max.\{f(x), g(x)\}$ then

$$h(x) = \begin{cases} f(x) & f(x) \ge g(x) \\ g(x) & g(x) > f(x) \end{cases}$$

(ii) A function h(x) is defined as

$h(x) = \min.\{f(x), g(x)\}$ then

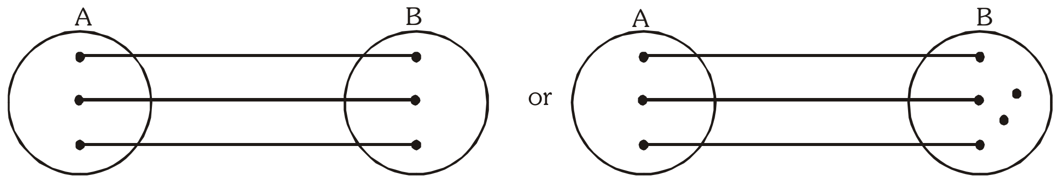
12. CLASSIFICATION OF FUNCTIONS :

One-One Function (Injective mapping) :

A function $f : A \to B$ is said to be a one-one function or injective mapping if different elements of A have different f images in B.

Thus there exist $x_1, x_2 \in A$ & $f(x_1), f(x_2) \in B$, $\boldsymbol{f(x_1) = f(x_2) \Leftrightarrow x_1 = x_2}$ **or** $\boldsymbol{x_1 \neq x_2 \Leftrightarrow f(x_1) \neq f(x_2)}$.

Diagramatically an injective mapping can be shown as

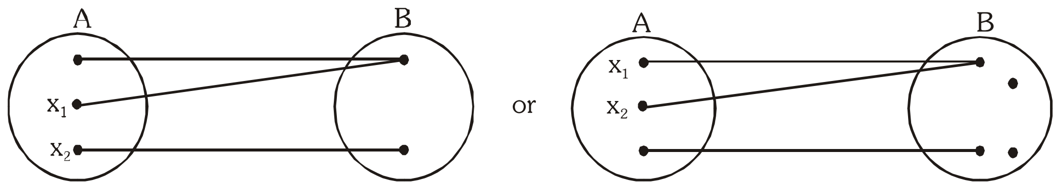


Many-one function (not injective) :

A function $f : A \to B$ is said to be a many one function if two or more elements of A have the same f image in B.

Thus $f : A \to B$ is many one there exist $x_1, x_2 \in A$, $\boldsymbol{f(x_1) = f(x_2)}$ **but** $\boldsymbol{x_1 \neq x_2}$.

Diagramatically a many one mapping can be shown as



Note :

(i) If a line parallel to x-axis cuts the graph of the function atmost at one point, then the function is one-one.

(ii) If any line parallel to x-axis cuts the graph of the function atleast at two points, then f is many-one.

(iii) If continuous function $f(x)$ is always increasing or decreasing in whole domain, then $f(x)$ is one-one.

(iv) All linear functions are one-one.

(v) All trigonometric functions in their domain are many one

(vi) All even degree polynomials are many one

(vii) Linear by Linear is one-one

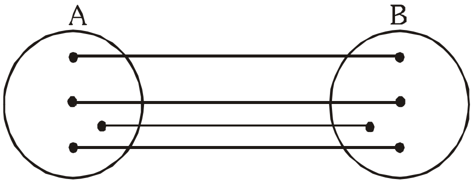
(viii) Quadratic by quadratic with no common factor is many one.

Onto function (Surjective mapping) :

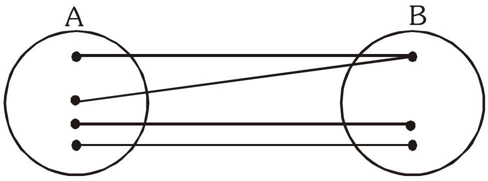
If the function $f : A \to B$ is such that each element in B (co-domain) is the f image of atleast one element in A, then we say that f is a function from A 'onto' B. Thus $f : A \to B$ is surjective iff $\forall\ b \in B, \exists$ some $a \in A$ such that $f(a) = b$.

node06\B0B0-BA\Kota\JEE(Advanced)\Module Coding (V-Tag)\Enthuse\Maths\Function & Inverse Trigo. Function (II & III)\Eng\01_Function.p65

Diagramatically surjective mapping can be shown as



or



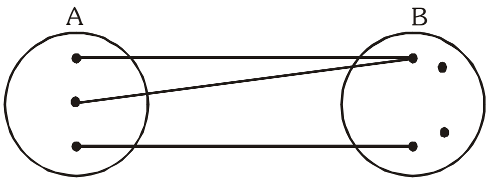
Note that : if range is same as co-domain, then f (x) is onto.

Into function :

If $f :\ A \rightarrow B$ is such that there exists atleast one element in co-domain which is not the image of any element in domain, then f (x) is into.

Diagramatically into function can be shown as

or



Note :

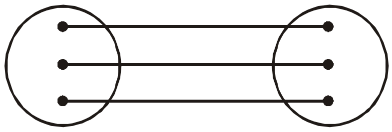
(i) A polynomial function of degree even define from $\mathbb{R} \rightarrow \mathbb{R}$ will always be into.

(ii) A polynomial function of degree odd defined from $\mathbb{R} \rightarrow \mathbb{R}$ will always be onto.

(iii) Quadratic by quadratic without any common factor define from $\mathbb{R} \rightarrow \mathbb{R}$ is always an into function.

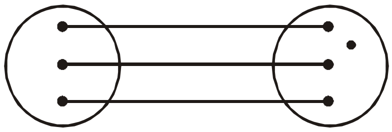
Thus a function can be one of these four types :

(i) one-one onto (injective & surjective)

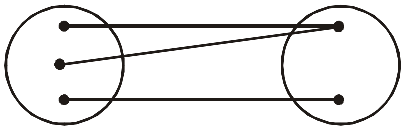


(also known as **Bijective** mapping)

(ii) one-one into (injective but not surjective)



(iii) many-one onto (surjective but not injective)



(iv) many-one into (neither surjective nor injective)

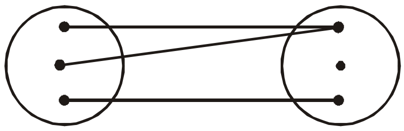


Illustration19 : Let $A = \{x : -1 \le x \le 1\} = B$ be a mapping $f : A \rightarrow B$. For each of the following functions from A to B, find whether it is bijective or non-bijective.

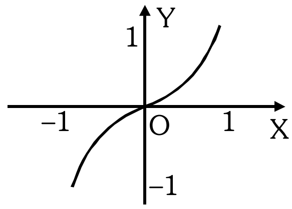
(a) $f(x) = x|x|$ (b) $f(x) = x^3$ (c) $f(x) = \sin\dfrac{\pi x}{2}$

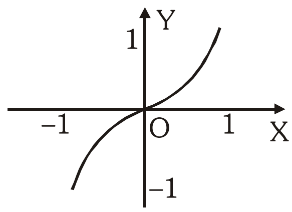
node06\B0B0-BA\Kota\JEE(Advanced)\Module Coding (V-Tag)\Enthuse\Maths\Function & Inverse Trigo. Function (II & III)\Eng\01_Function.p65

Solution : (a) $f(x) = x|x| = \begin{cases} -x^2 & , -1 < x < 0 \\ x^2 & , 0 \le x < 1 \end{cases}$,



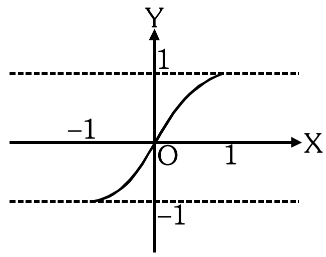
Graphically,
The graph shows f(x) is one-one, as the straight line parallel to x-axis cuts only at one point.
Here, range
$f(x) \in [-1, 1]$
Thus, range = co-domain
Hence, onto.
Therefore, f(x) is one-one onto or (Bijective).

(b) $f(x) = x^3$,



Graphically;
Graph shows f(x) is one-one onto
(i.e. Bijective)
[as explained in above example]

(c) $f(x) = \sin\frac{\pi x}{2}$



Graphically;
Which shows f(x) is one-one and onto as range = co-domain.
Therefore, f(x) is bijective.

Illustration 20 : Let $f : \mathbb{N} \to \mathbb{Z}$ be a function defined as $f(x) = x - 1000$. Show that $f(x)$ is an into function.

Solution : Let $f(x) = y = x - 1000 \Rightarrow x = y + 1000 = g(y)$ (say)
here g(y) is defined for each $y \in \mathbb{Z}$, but $g(y) \notin \mathbb{N}$ for $y \le -1000$.
Hence $f(x)$ is into.

Illustration 21 : Let $f : \mathbb{R} \to \mathbb{R}$ be a function defined by $f(x) = x + \sqrt{x^2}$, then f is

(A) injective (B) surjective (C) bijective (D) None of these

Solution : We have, $f(x) = x + \sqrt{x^2} = x + |x|$
Clearly, f is not one-one as $f(-1) = f(-2) = 0$ and $-1 \ne -2$
Also, f is not onto as $f(x) \ge 0 \ \forall \ x \in \mathbb{R}$
$\therefore$ range of f = $(0, \infty) \subset \mathbb{R}$ **Ans.(D)**

Illustration 22 : Let $f : \mathbb{R} \to \mathbb{R}$ be a function defined as $f(x) = 2x^3 + 6x^2 + 12x + 3\cos x - 4\sin x$; then f is -

(A) Injective (B) Surjective (C) Bijective (D) Not Surjective

Solution : We have $f(x) = 2x^3 + 6x^2 + 12x + 3\cos x - 4\sin x$

$\Rightarrow f'(x) = 6x^2 - 12x + 12 - 3\sin x - 4\cos x$

$$f'(x) = \underbrace{6(x-1)^2 + 6}_{g(x)} - \underbrace{(3\sin x + 4\cos x)}_{h(x)}$$

range of $g(x) = [6, \infty)$
range of $h(x) = [-5, 5]$
hence $f'(x)$ always lies in the interval $[1, \infty)$
$\Rightarrow f'(x) > 0$

node06\B0B0-BA\Kota\JEE(Advanced)\Module Coding (V-Tag)\Enthuse\Maths\Function & Inverse Trigo. Function (II & III)\Eng\01_Function.p65

Hence f (x) is increasing i.e. one-one function

Now $x \to \infty \Rightarrow f \to \infty$ & $x \to -\infty \Rightarrow f \to -\infty$ & $f(x)$ is continuous

hence its range is $\mathbb{R} \Rightarrow f$ is onto so f is bijective. **Ans. (C)**

Illustration 23 : Let $f(x) = \dfrac{x^2+3x+a}{x^2+x+1}$, where $f : \mathbb{R} \to \mathbb{R}$. Find the value of parameter 'a' so that the given function is one-one.

Solution : $f(x) = \dfrac{x^2+3x+a}{x^2+x+1}$

$$f'(x) = \frac{(x^2+x+1)(2x+3)-(x^2+3x+a)(2x+1)}{(x^2+x+1)^2} = \frac{-2x^2+2x(1-a)+(3-a)}{(x^2+x+1)^2}$$

Let, $g(x) = -2x^2 + 2x(1-a) + (3-a)$

$g(x)$ will be negative if $4(1-a)^2 + 8(3-a) < 0$

$\Rightarrow 1 + a^2 - 2a + 6 - 2a < 0 \Rightarrow (a-2)^2 + 3 < 0$

which is not possible. Therefore function is not monotonic.

Hence, no value of a is possible.

(iii) A mapping $f : A \to [-1,1]$ defined by $f(x) = \sin x$, $\forall\, x \in \mathbb{R}$, where A is a subset of $\mathbb{R}$ (the set of all real numbers) is one-one and onto if A is the interval, then A is belongs to

(A) $[0,2\pi]$ (B) $\left[-\dfrac{\pi}{2},\dfrac{\pi}{2}\right]$ (C) $[-\pi,\pi]$ (D) $[0,\pi]$

13. COMPOSITE OF UNIFORMLY & NON-UNIFORMLY DEFINED FUNCTION:

Let $f : A \to B$ & $g : B \to C$ be two functions. Then the function $gof : A \to C$ defined by $(gof)(x) = g(f(x))$ $\forall\, x \in A$ is called the composite of the two functions f & g.

Diagramatically $\xrightarrow{x} \boxed{f} \xrightarrow{f(x)} \boxed{g} \longrightarrow g(f(x))$

Thus the image of every $x \in A$ under the function gof is the g-image of f-image of x.

Note that gof is defined only if $\forall\, x \in A$, f(x) is an element of the domain of 'g' so that we can take its g-image.

Properties of composite functions:

(a) In general composite of functions is not commutative i.e. $gof \neq fog$.

(b) The composition of functions is associative i.e. if f, g, h are three functions such that fo(goh) & (fog)oh are defined, then fo(goh) = (fog)oh.

Note : Domain of fog(x) is $x \in \mathbb{R} - \{1\}$

$(gof)(x) = g(f(x)) = g(x^2 + 1) = g(u)$, where $u = x^2+1$

$$= \frac{1}{u-1} = \frac{1}{x^2+1-1} = \frac{1}{x^2}$$

Note : Domain of gof(x) is $x \in \mathbb{R} - \{0\}$

Solution : Given $(gof)\left(\dfrac{-5}{3}\right) - (fog)\left(\dfrac{-5}{3}\right) = g\left\{f\left(\dfrac{-5}{3}\right)\right\} - f\left\{g\left(\dfrac{-5}{3}\right)\right\} = g(-2) - f\left(\dfrac{5}{3}\right) = 2 - 1 = 1$

Ans.(A)

14. INVERSE OF A FUNCTION :

Let f : A $\rightarrow$ B be a one-one & onto function, then there exists a unique function g : B $\rightarrow$ A such that f(x) = y $\Leftrightarrow$ g(y) = x, $\forall$ x $\in$ A & y $\in$ B. Then g is said to be inverse of f.

Thus $g = f^{-1} : B \rightarrow A = \{(f(x), x) | (x, f(x)) \in f\}$.

Properties of inverse function :

(a) The inverse of a bijection is unique.

(b) If f : A $\rightarrow$ B is a bijection & g : B $\rightarrow$ A is the inverse of f, then fog = I_B and gof = I_A, where I_A & I_B are identity functions on the sets A & B respectively. If fof = I, then f is inverse of itself.

(c) The inverse of a bijection is also a bijection.

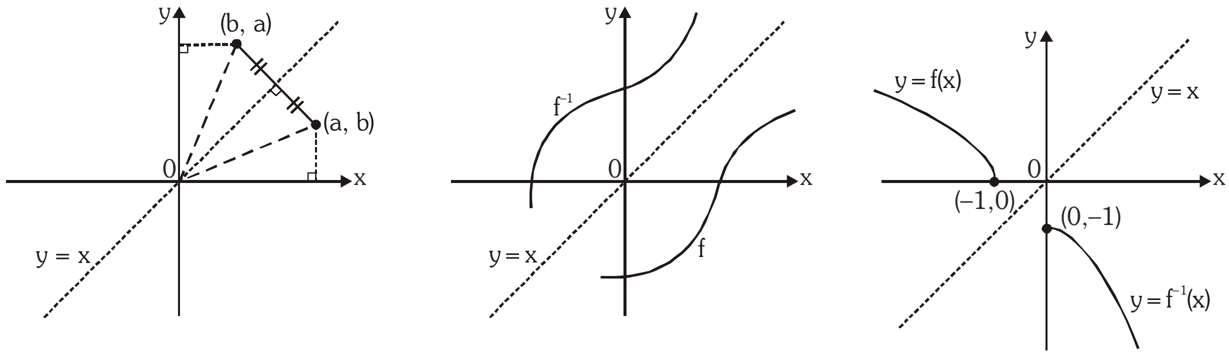
(d) If f & g are two bijections f : A $\rightarrow$ B, g : B $\rightarrow$ C then the inverse of gof exists and

$(gof)^{-1} = f^{-1} \text{ o } g^{-1}$.

node06\B0B0-BA\Kota\JEE(Advanced)\Module Coding (V-Tag)\Enthuse\Maths\Function & Inverse Trigo. Function (II & III)\Eng\01_Function.p65

(e) Since $f(a) = b$ if and only if $f^{-1}(b) = a$, the point (a, b) is on the graph of 'f' if and only if the point (b, a) is on the graph of f^{-1}. But we get the point (b, a) from (a, b) by reflecting about the line

$y = x$.



$\boxed{\text{The graph of } f^{-1} \text{ is obtained by reflecting the graph of f about the line } y = x.}$

Drawing the graph of $y = f^{-1}(x)$ from the known graph of $y = f(x)$

For drawing the graph of $y = f^{-1}(x)$ take the reflection of $y = f(x)$ about the line $y = x$. The reflected part would give us the graph of $y = f^{-1}(x)$.

e.g. let us draw the graph of $y = \sin^{-1}x$. We know that $y = f(x) = \sin x$ is invertible if $f : \left[-\frac{\pi}{2}, \frac{\pi}{2}\right] \to [-1, 1]$

$\Rightarrow$ the inverse mapping would be $f^{-1} : [-1, 1] \to \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$.

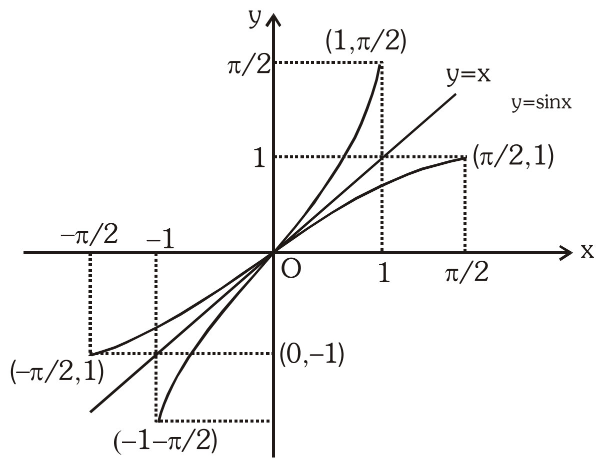


Illustration 28 : Let $f : \mathbb{R} \to \mathbb{R}$ be defined by $f(x) = (e^x - e^{-x})/2$. Is f(x) invertible ? If so, find its inverse.

Solution : Let us check for invertibility of f(x) :

(a) One-One :

$$f(x) = \frac{1}{2}\left(e^x - e^{-x}\right) \Rightarrow f'(x) = \frac{1}{2}\left(e^x + e^{-x}\right)$$

$\Rightarrow f'(x) > 0$, $f(x)$ is increasing function

$\therefore f(x)$ is one-one function.

node06\B0B0-BA\Kota\JEE(Advanced)\Module Coding(V-Tag)\Enthuse\Maths\Function & Inverse Trigo. Function (II & III)\Eng\01_Function.p65

(b) Onto :

As x tends to larger and larger values so does f(x) and

when $x \to \infty$, $f(x) \to \infty$.

Similarly as $x \to -\infty$, $f(x) \to -\infty$ i.e. $-\infty < f(x) < \infty$ so long as $x \in (-\infty, \infty)$

Hence the range of f is same as the set R. Therefore f(x) is onto.

Since f(x) is both one-one and onto, f(x) is invertible.

(c) To find $f^{-1}(x)$: Interchange x & y

$$\frac{e^y - e^y}{2} = x \Rightarrow e^{2y} - 2xe^y - 1 = 0$$

$$\Rightarrow \quad e^y = \frac{2x \pm \sqrt{4x^2 + 4}}{2} \Rightarrow e^y = x \pm \sqrt{1 + x^2}$$

Since $e^y > 0$, hence negative sign is ruled out and

Hence $e^y = x + \sqrt{1 + x^2}$

Taking logarithm, we have $y = \ell n(x + \sqrt{1 + x^2})$ or $f^{-1}(x) = \ell n(x + \sqrt{1 + x^2})$

Illustration 29 : Find the inverse of the function $f(x) = \log_a\left(x + \sqrt{(x^2 + 1)}\right)$; $a > 1$ and assuming it to be an onto function.

Solution : Given $f(x) = \log_a\left(x + \sqrt{x^2 + 1}\right)$

$$\therefore \quad f'(x) = \frac{\log_a e}{\sqrt{(1 + x^2)}} > 0$$

which is a strictly increasing functions.

Thus, f(x) is injective, given that f(x) is onto. Hence the given function f(x) is invertible.

Interchanging x & y

$$\Rightarrow \log_a\left(y + \sqrt{(y)^2 + 1}\right) = x$$

$$\Rightarrow y + \sqrt{(y)^2 + 1} = a^x \quad \text{...(i)}$$

$$\text{and } \sqrt{(y)^2 + 1} - y = a^{-x} \quad \text{...(ii)}$$

From (i) and (ii), we get $y = \frac{1}{2}(a^x - a^{-x})$ or $f^{-1}(x) = \frac{1}{2}(a^x - a^{-x})$

Illustration 30 : Find the inverse of the function $f(x) = \ell n(x^2 + 3x + 1)$; $x \in [1,3]$ and assuming it to be an onto function.

Solution : Given $f(x) = \ell n(x^2 + 3x + 1)$

$$\therefore \quad f'(x) = \frac{2x + 3}{(x^2 + 3x + 1)} > 0 \, \forall x \in [1,3]$$

Which is a strictly increasing function. Thus f(x) is injective, given that f(x) is onto. Hence the given function f(x) is invertible.

Interchanging x & y

$\Rightarrow (y)^2 + 3(y) + 1 - e^x = 0$

$$\therefore\ y = \frac{-3 \pm \sqrt{9 - 4.\left(1 - e^x\right)}}{2} = \frac{-3 \pm \sqrt{\left(5 + 4e^x\right)}}{2}$$

$$\Rightarrow\ y = \frac{-3 + \sqrt{\left(5 + 4e^x\right)}}{2} \qquad \text{(as } y \in [1,3])$$

Hence $f^{-1}(x) = \dfrac{-3 + \sqrt{\left(5 + 4e^x\right)}}{2}$

Do yourself - 9 :

(i) Let $f : [-1, 1] \rightarrow [-1, 1]$ defined by $f(x) = x|x|$, find $f^{-1}(x)$.

(ii) $f(x) = 1 + \ell n(x + 2)$, find $f^{-1}(x)$.

15. ODD & EVEN FUNCTIONS :

Consider a function $f(x)$ such that both x and –x are in its domain then

$$\text{If } \begin{cases} f(-x) = f(x) & \text{then } f \text{ is said to be an even function} \\ f(-x) = -f(x) & \text{then } f \text{ is said to be an odd function} \end{cases}$$

Note :

(i) $f(x) - f(-x) = 0 \ \Rightarrow\ f(x)$ is even & $f(x) + f(-x) = 0 \Rightarrow f(x)$ is odd.

(ii) A function may neither be odd nor even.

(iii) The only function which is defined on the entire number line & is even and odd at the same time is $f(x) = 0$.

(iv) Every constant function is even function.

(v) Inverse of an even function is not defined.

(vi) Every even function is symmetric about the y-axis & every odd function is symmetric about the origin.

Special Note : If a function $f(x)$ is defined as $f(a + x) = f(a - x)$ then this function is symmetric about line x = a

(vii) Every function which has '–x' in it's domain whenever 'x' is in it's domain, can be expressed as the sum of an even & an odd function .

$$\text{i.e. } f(x) = \underbrace{\frac{f(x) + f(-x)}{2}}_{\text{EVEN}} + \underbrace{\frac{f(x) - f(-x)}{2}}_{\text{ODD}}$$

(viii) If $f(x)$ is odd and defined at x = 0, then $f(0) = 0$.

$f(x)$	g(x)	$f(x) + g(x)$	$f(x) - g(x)$	$f(x) \cdot g(x)$	$f(x)/g(x)$	$(g o f)(x)$	$(f o g)(x)$
odd	odd	odd	odd	even	even	odd	odd
even	even	even	even	even	even	even	even
odd	even	neither odd nor even	neither odd nor even	odd	odd	even	even
even	odd	neither odd nor even	neither odd nor even	odd	odd	even	even

Illustration 31 : Which of the following functions is (are) even, odd or neither :

(i) $f(x) = x^2 \sin x$ (ii) $f(x) = \sin x - \cos x$ (iii) $f(x) = \dfrac{e^x + e^{-x}}{2}$

Solution : (i) $f(-x) = (-x)^2 \sin(-x) = -x^2 \sin x = -f(x)$. Hence f(x) is odd.

(ii) $f(-x) = \sin(-x) - \cos(-x) = -\sin x - \cos x$.

Hence f(x) is neither even nor odd.

(iii) $f(-x) = \dfrac{e^{-x} + e^{-(-x)}}{2} = \dfrac{e^{-x} + e^{x}}{2} = f(x)$. Hence f(x) is even

Illustration 32: Identify the given functions as odd, even or neither :

(i) $f(x) = \dfrac{x}{e^x - 1} + \dfrac{x}{2} + 1$ (ii) $f(x + y) = f(x) + f(y)$ for all $x, y \in \mathbb{R}$

Solution : (i) $f(x) = \dfrac{x}{e^x - 1} + \dfrac{x}{2} + 1$

Clearly domain of f(x) is $\mathbb{R} \sim \{0\}$. We have,

$$f(-x) = \frac{-x}{e^{-x} - 1} - \frac{x}{2} + 1 = \frac{-e^x . x}{1 - e^x} - \frac{x}{2} + 1 = \frac{(e^x - 1 + 1)x}{(e^x - 1)} - \frac{x}{2} + 1$$

$$= x + \frac{x}{e^x - 1} - \frac{x}{2} + 1 = \frac{x}{e^x - 1} + \frac{x}{2} + 1 = f(x)$$

Hence f(x) is an even function.

(ii) $f(x + y) = f(x) + f(y)$ for all $x, y \in \mathbb{R}$

Replacing x, y by zero, we get $f(0) = 2f(0) \Rightarrow f(0) = 0$

Replacing y by –x, we get $f(x) + f(-x) = f(0) = 0 \Rightarrow f(x) = -f(-x)$

Hence f(x) is an odd function.

Do yourself - 10 :

(i) Which of the following functions is (are) even, odd or neither :

(a) $f(x) = x^3 \sin 3x$ (b) $f(x) = \dfrac{e^{x^2} + e^{-x^2}}{2x}$

(c) $f(x) = \dfrac{e^x - e^{-x}}{e^x + e^{-x}}$ (d) $f(x) = x^2 + 2^x$

16. PERIODIC FUNCTION :

A function $f(x)$ is called periodic if there exists a positive number T such that $f(x+T) = f(x) = f(x-T)$, for all values of x within the domain of f. Smallest positive T (if exists) is called fundamental period of function $f(x)$.

Note :

(i) Odd powers of sinx, cosx, secx, cosecx are periodic with period 2π.

(ii) None zero integral powers of tanx, cotx are periodic with period π.

(iii) Non zero even powers or modulus of sinx, cosx, secx, cosecx are periodic with period π.

(iv) $f(T) = f(0) = f(-T)$, where 'T' is the period.

(v) if $f(x)$ has a period T then **f (ax + b) has a period T/|a|** $(a \neq 0)$.

Proof : Let $f(x + T) = f(x)$ and $f[a(x + T') + b] = f(ax + b)$

$f(ax + b + aT') = f(ax + b)$

$f(y + aT') = f(y) = f(y + T) \Rightarrow T = aT' \Rightarrow T' = \dfrac{T}{a}$

(vi) If $f(x)$ & $g(x)$ are periodic with period T_1 & T_2 respectively, then a period (need not be fundamental) of $f(x) \pm g(x)$ is L.C.M. of (T_1, T_2).

(a) LCM of T_1 & T_2 is defined when T_1/T_2 is rational.

(b) LCM of $\left\{\dfrac{a}{b}, \dfrac{p}{q}\right\} = \dfrac{\text{LCM of }(a, p)}{\text{HCF of }(b, q)}$

In case if there exists a positive K such that K < LCM of T_1 and T_2 and overall function repeats itself after every K, then fundamental period of the function will be K.

(vii) Every constant function is always periodic, whose fundamental period is undefined.

(viii) Periodic functions are non invertible.

Illustration 33 : Find the fundamental periods (if periodic) of the following functions, where [.] denotes the greatest integer function

(i) $f(x) = e^{\ell n(\sin x)} + \tan^3 x - \text{cosec}(3x - 5)$

(ii) $f(x) = x - [x - b],\ b \in \mathbb{R}$

(iii) $f(x) = \dfrac{|\sin x + \cos x|}{|\sin x| + |\cos x|}$

(iv) $f(x) = \tan\dfrac{\pi}{2}[x]$

(v) $f(x) = \cos(\sin x) + \cos(\cos x)$

(vi) $f(x) = \dfrac{(1+\sin x)(1+\sec x)}{(1+\cos x)(1+\text{cosec}\, x)}$

(vii) $f(x) = e^{x-[x]+|\cos \pi x|+|\cos 2\pi x|+........+|\cos n\pi|}$

Solution :

(i) $f(x) = e^{\ell n(\sin x)} + \tan^3 x - \text{cosec}(3x - 5)$

Period of $e^{\ell n \sin x} = 2\pi$, $\tan^3 x = \pi$

$\text{cosec}\,(3x - 5) = \dfrac{2\pi}{3}$

$\therefore$ Period $= 2\pi$

(ii) $f(x) = x - [x - b] = b + \{x - b\}$

$\therefore$ Period $= 1$

(iii) $f(x) = \dfrac{|\sin x + \cos x|}{|\sin x| + |\cos x|}$

Since period of $|\sin x + \cos x| = \pi$ and period of $|\sin x| + |\cos x|$ is $\dfrac{\pi}{2}$. Hence f(x) is periodic with π as its period

(iv) $f(x) = \tan\dfrac{\pi}{2}[x]$

$\tan\dfrac{\pi}{2}[x + T] = \tan\dfrac{\pi}{2}[x] \Rightarrow \dfrac{\pi}{2}[x + T] = n\pi + \dfrac{\pi}{2}[x]$

$\therefore$ T = 2

$\therefore$ Period = 2

(v) Let f(x) is periodic then f(x + T) = f(x)

$\Rightarrow$ cos(sin(x + T))+ cos(cos(x + T)) = cos(sinx) + cos(cosx)

If x = 0 then cos(sinT) + cos(cosT)

$= \cos(0) + \cos(1) = \cos\left(\cos\dfrac{\pi}{2}\right) + \cos\left(\sin\dfrac{\pi}{2}\right)$

On comparing $T = \dfrac{\pi}{2}$

(vi) $f(x) = \dfrac{(1+\sin x)(1+\sec x)}{(1+\cos x)(1+\operatorname{cosec} x)} = \dfrac{(1+\sin x)(1+\cos x)\sin x}{\cos x(1+\sin x)(1+\cos x)}$

$\Rightarrow$ f(x) = tanx

Hence f(x) has period π.

(vii) $f(x) = e^{x-[x]+|\cos\pi x|+|\cos 2\pi x|+........+|\cos n\pi|}$

Period of x – [x] = 1

Period of $|\cos\pi x| = 1$

Period of $|\cos 2\pi x| = \dfrac{1}{2}$

....

Period of $|\cos n\pi x| = \dfrac{1}{n}$

So period of f(x) will be L.C.M. of all period = 1

Illustration 34 : Find the fundamental periods (if periodic) of the following functions, where [.] denotes the greatest integer function

(i) $f(x) = e^{x-[x]} + \sin x$ (ii) $f(x) = \sin\dfrac{\pi x}{\sqrt{2}} + \cos\dfrac{\pi x}{\sqrt{3}}$ (iii) $f(x) = \sin\dfrac{\pi x}{\sqrt{3}} + \cos\dfrac{\pi x}{2\sqrt{3}}$

Solution : (i) Period of $e^{x-[x]} = 1$

period of sinx = 2π

$\because$ L.C.M. of rational and an irrational number does not exist.

$\therefore$ not periodic.

(ii) Period of $\sin\frac{\pi x}{\sqrt{2}} = \frac{2\pi}{\pi/\sqrt{2}} = 2\sqrt{2}$

Period of $\cos\frac{\pi x}{\sqrt{3}} = \frac{2\pi}{\pi/\sqrt{3}} = 2\sqrt{3}$

$\because$ L.C.M. of two different kinds of irrational number does not exist.

$\therefore$ not periodic.

(iii) Period of $\sin\frac{\pi x}{\sqrt{3}} = \frac{2\pi}{\pi/\sqrt{3}} = 2\sqrt{3}$

Period of $\cos\frac{\pi x}{2\sqrt{3}} = \frac{2\pi}{\pi/2\sqrt{3}} = 4\sqrt{3}$

$\because$ L.C.M. of two similar irrational number exist.

$\therefore$ Periodic with period = $4\sqrt{3}$ **Ans.**

Do yourself - 11 :

(i) Find the fundamental periods (if periodic) of the following functions.

(a) $f(x) = \ell n(\cos x) + \tan^3 x$.

(b) $f(x) = e^{x-[x]}$, [.] denotes greatest integer function

(c) $f(x) = \left|\sin\frac{x}{2}\right| + \left|\cos\frac{x}{2}\right|$

17. GENERAL :

If x, y are independent variables and f is a continuous function, then :

(a) $f(xy) = f(x) + f(y) \Rightarrow f(x) = k\ell n\, x$

(b) $f(xy) = f(x) \,.\, f(y) \Rightarrow f(x) = x^n,\ n \in \mathbb{R}$ or $f(x) = 0$

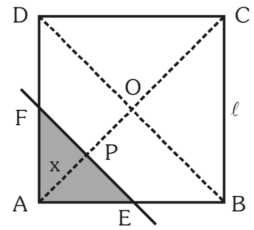
(c) $f(x + y) = f(x) \,.\, f(y) \Rightarrow f(x) = a^{kx}$ or $f(x) = 0$

(d) $f(x + y) = f(x) + f(y) \Rightarrow f(x) = kx$, where k is a constant.

Miscellaneous Illustration :

Illustration 35 : ABCD is a square of side ℓ. A line parallel to the diagonal BD at a distance 'x' from the vertex A cuts two adjacent sides. Express the area of the segment of the square with A at a vertex, as a function of x. Find this area at $x = 1/\sqrt{2}$ and at x = 2, when $\ell = 2$.

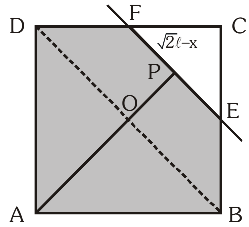
Solution : There are two different situations



Case-I : when $x = AP \le OA$, i.e., $x \le \frac{\ell}{\sqrt{2}}$

$$ar(\Delta AEF) = \frac{1}{2}x.2x = x^2 \quad (\because PE = PF = AP = x)$$

Case-II : when x = AP > OA, i.e., $x > \frac{\ell}{\sqrt{2}}$ but $x \le \sqrt{2}\ell$



ar(ABEFDA) = ar(ABCD) − ar(ΔCFE)

$$= \ell^2 - \frac{1}{2}\left(\sqrt{2}\ell - x\right).2\left(\sqrt{2}\ell - x\right) \quad [\because \quad CP = \sqrt{2}\ell - x\,]$$

$$= \ell^2 - \left(2\ell^2 + x^2 - 2\sqrt{2}\ell x\right) = 2\sqrt{2}\ell x - x^2 - \ell^2$$

$\therefore$ the required function s(x) is as follows :

$$s(x) = \begin{cases} x^2, & 0 \le x \le \frac{\ell}{\sqrt{2}} \\ 2\sqrt{2}\,\ell x - x^2 - \ell^2, & \frac{\ell}{\sqrt{2}} < x \le \sqrt{2}\ell \end{cases} \quad ; \text{ area of } s(x) = \begin{cases} \frac{1}{2} \text{ at } x = \frac{1}{\sqrt{2}} \\ 8(\sqrt{2}-1) \text{ at } x = 2 \end{cases}$$

Ans.

Illustration 36 : If the function f(x) satisfies the functional rule, f(x + y) = f(x) + f(y) $\forall$ x,y $\in \mathbb{R}$ & f(1) = 5, then find $\sum_{n=1}^{m} f(n)$.

Solution : Here, f(x + y) = f(x) + f(y); put x = t − 1, y = 1

f(t) = f(t − 1) + f(1) ....(1)

$\therefore$ f(t) = f(t − 1) + 5

$\Rightarrow$ f(t) = {f(t − 2) + 5} + 5

$\Rightarrow$ f(t) = f(t − 2) + 2(5)

$\Rightarrow$ f(t) = f(t − 3) + 3(5)

....

....

$\Rightarrow$ f(t) = f{t − (t −1)} + (t − 1)5

$\Rightarrow$ f(t) = f(1)+ (t − 1)5

$\Rightarrow$ f(t) = 5 + (t − 1)5

$\Rightarrow$ f(t) = 5t

$$\therefore \quad \sum_{n=1}^{m} f(n) = \sum_{n=1}^{m} (5n) = 5[1 + 2 + 3 + ... + m] = \frac{5m(m+1)}{2}$$

Hence, $\sum_{n=1}^{m} f(n) = \frac{5m(m+1)}{2}$.

INVERSE TRIGONOMETRIC FUNCTION

1. INTRODUCTION :

The inverse trigonometric functions, denoted by $\sin^{-1}x$ or (arc sinx), $\cos^{-1}x$ etc., denote the angles whose sine, cosine etc, is equal to x. The angles are usually the numerically smallest angles, except in the case of $\cot^{-1}x$ and if positive & negative angles have same numerical value, the positive angle has been chosen.

It is worthwhile noting that the functions sinx, cosx etc are in general not invertible. Their inverse is defined by choosing an appropriate domain & co-domain so that they become invertible. For this reason the chosen value is usually the simplest and easy to remember.

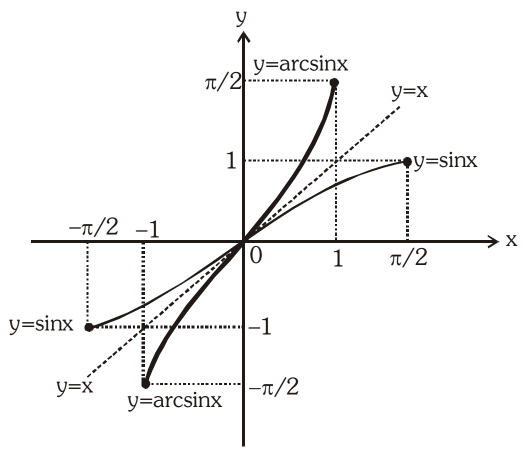
2. DOMAIN & RANGE OF INVERSE TRIGONOMETRIC FUNCTIONS :

S.No	f (x)	Domain	Range
(1)	$\sin^{-1}x$	$\lvert x\rvert \le 1$	$\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$
(2)	$\cos^{-1}x$	$\lvert x\rvert \le 1$	$[0, \pi]$
(3)	$\tan^{-1}x$	$x \in \mathbb{R}$	$\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$
(4)	$\sec^{-1}x$	$\lvert x\rvert \ge 1$	$[0, \pi]-\left\{\frac{\pi}{2}\right\}$ or $\left[0, \frac{\pi}{2}\right)\cup\left(\frac{\pi}{2}, \pi\right]$
(5)	$\text{cosec}^{-1}x$	$\lvert x\rvert \ge 1$	$\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]-\{0\}$
(6)	$\cot^{-1}x$	$x \in \mathbb{R}$	$(0, \pi)$

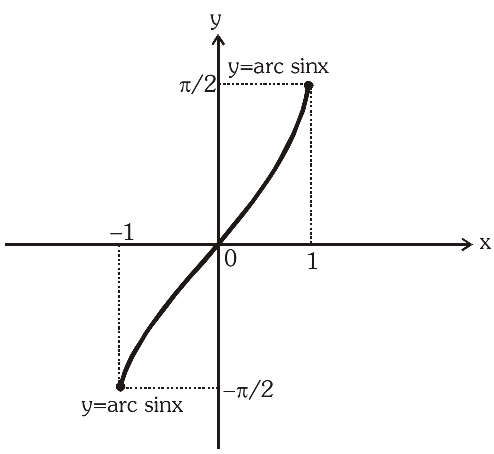
3. GRAPH OF INVERSE TRIGONOMETRIC FUNCTIONS :

(a) $f : \left[\frac{-\pi}{2}, \frac{\pi}{2}\right] \to [-1, 1]$ $\qquad$ $f^{-1} : [-1, 1] \to [-\pi/2, \pi/2]$

$f(x) = \sin x$ $\qquad$ $f^{-1}(x) = \sin^{-1}(x)$



(Taking image of sin x about y = x to get $\sin^{-1}x$)



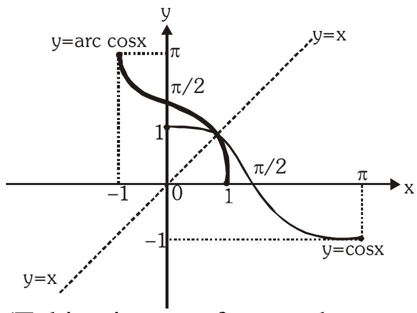
($y = \sin^{-1}x$)

(b) $f : [0, \pi] \to [-1, 1]$

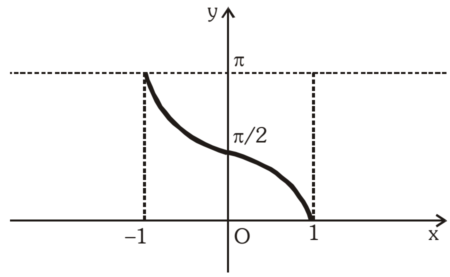
$f(x) = \cos x$

$f^{-1} : [-1, 1] \to [0, \pi]$

$f^{-1}(x) = \cos^{-1} x$



(Taking image of cos x about y = x)



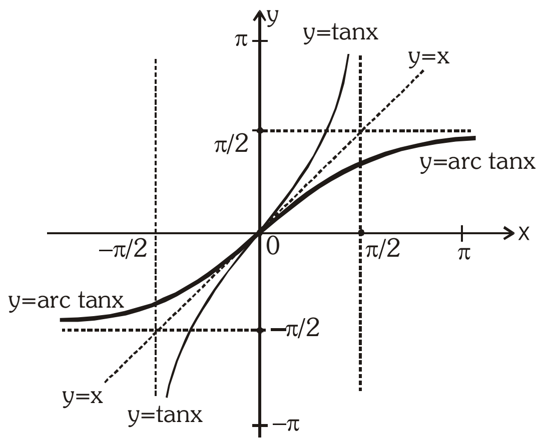
($y = \cos^{-1}x$)

(c) $f : (-\pi/2, \pi/2) \to \mathbb{R}$

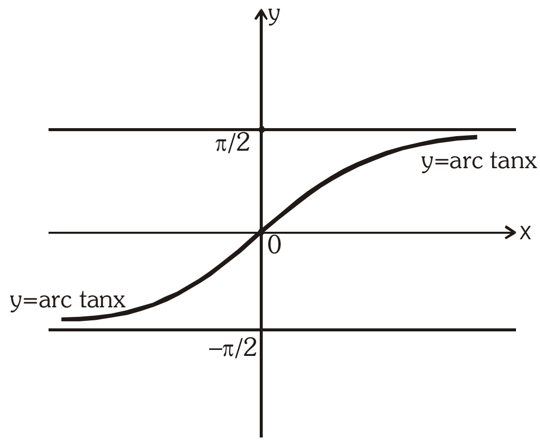
$f(x) = \tan x$

$f^{-1} : \mathbb{R} \to (-\pi/2, \pi/2)$

$f^{-1}(x) = \tan^{-1} x$



(Taking image of tan x about y = x)



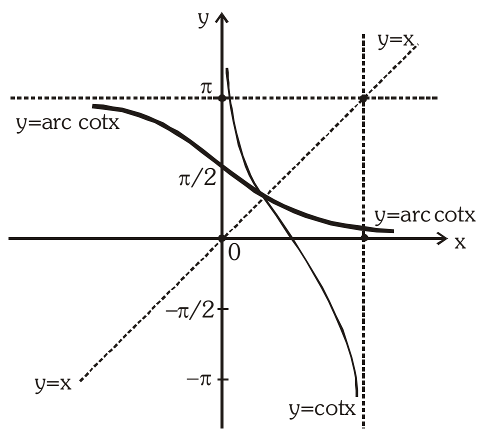
($y = \tan^{-1}x$)

(d) $f : (0, \pi) \to \mathbb{R}$

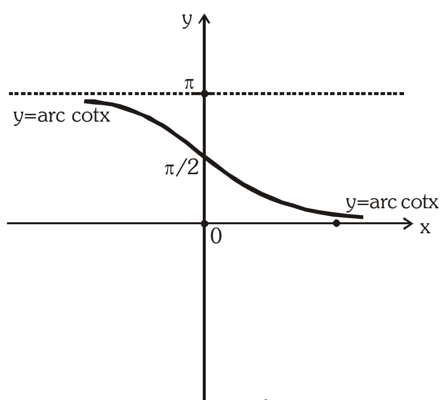
$f(x) = \cot x$

$f^{-1} : \mathbb{R} \to (0, \pi)$

$f^{-1}(x) = \cot^{-1} x$



(Taking image of cot x about y = x)



($y = \cot^{-1}x$)

(e) $f : [0, \pi/2) \cup (\pi/2, \pi] \to (-\infty, -1] \cup [1, \infty)$

$f(x) = \sec x$

$f^{-1} : (-\infty, -1] \cup [1, \infty) \to [0, \pi/2) \cup (\pi/2, \pi]$

$f^{-1}(x) = \sec^{-1} x$

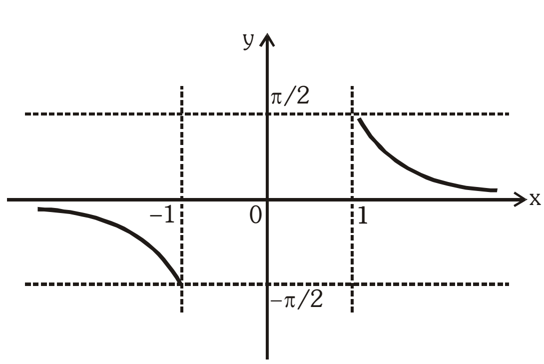
(f) $f : [-\pi/2, 0) \cup (0, \pi/2] \rightarrow (-\infty, -1] \cup [1, \infty)$



$f(x) = \text{cosec } x$

$f^{-1} : (-\infty, -1] \cup [1, \infty) \rightarrow [-\pi/2, 0) \cup (0, \pi/2]$

$f^{-1}(x) = \text{cosec}^{-1} x$

From the above discussions following IMPORTANT points can be concluded :

(i) All the inverse trigonometric functions represent an angle.

(ii) If $x > 0$, then all six inverse trigonometric functions viz $\sin^{-1} x$, $\cos^{-1} x$, $\tan^{-1} x$, $\sec^{-1} x$, $\text{cosec}^{-1} x$, $\cot^{-1} x$ represent an acute angle.

(iii) If $x < 0$, then $\sin^{-1} x$, $\tan^{-1} x$ & $\text{cosec}^{-1} x$ represent an angle from $-\pi/2$ to 0 (IV[th] quadrant)

(iv) If $x < 0$, then $\cos^{-1} x$, $\cot^{-1} x$ & $\sec^{-1} x$ represent an obtuse angle. (II[nd] quadrant)

(v) III[rd] quadrant is never used in range of inverse trigonometric function.

Illustration 1 : The value of $\tan^{-1}(1) + \cos^{-1}\left(-\frac{1}{2}\right) + \sin^{-1}\left(-\frac{1}{2}\right)$ is equal to

(A) $\frac{\pi}{4}$ (B) $\frac{5\pi}{12}$ (C) $\frac{3\pi}{4}$ (D) $\frac{13\pi}{12}$

Solution : $\tan^{-1}(1) + \cos^{-1}\left(-\frac{1}{2}\right) + \sin^{-1}\left(-\frac{1}{2}\right) = \frac{\pi}{4} + \frac{2\pi}{3} - \frac{\pi}{6} = \frac{\pi}{4} + \frac{\pi}{2} = \frac{3\pi}{4}$ **Ans.(C)**

Illustration 2 : If $\sum_{i=1}^{2n} \cos^{-1} x_i = 0$ then find the value of $\sum_{i=1}^{2n} x_i$

Solution : We know, $0 \le \cos^{-1} x \le \pi$

Hence, each value $\cos^{-1}x_1, \cos^{-1}x_2, \cos^{-1}x_3, ..., \cos^{-1}x_{2n}$ are non-negative their sum is zero only when each value is zero.

i.e., $\cos^{-1}x_i = 0$ for all i

$\Rightarrow$ $x_i = 1$ for all i

$\therefore$ $\sum_{i=1}^{2n} x_i = x_1 + x_2 + x_3 + ... + x_{2n} = \underbrace{\{1 + 1 + 1 .... + 1\}}_{2n \text{ times}} = 2n$ {using (i)}

$\Rightarrow$ $\sum_{i=1}^{2n} x_i = 2n$ **Ans.**

(ii) $y = \cos(\cos^{-1} x) = x$

(iii) $y = \tan(\tan^{-1} x) = x$

(iv) $\tan\left\{2\tan^{-1}\frac{1}{5}-\frac{\pi}{4}\right\}$

Solution : (i) Let $\cos^{-1} 3/5 = \theta$. Then,

$\cos\theta = 3/5 \quad \Rightarrow \quad \sin\theta = 4/5$

$\therefore \quad \sin(\cos^{-1} 3/5) = \sin\theta = 4/5$

node06\B0B0-BA\Kota\JEE(Advanced)\Module Coding (V-Tag)\Enthuse\Maths\Function & Inverse Trigo. Function (II & III)\Eng\02_INVERSE.p65

Solution : (i) We know that $\sin^{-1}(\sin\theta) = \theta$, if $-\pi/2 \le \theta \le \pi/2$

Here, $\theta = 10$ radians which does not lie between $-\pi/2$ and $\pi/2$

But, $3\pi - \theta$ i.e., $3\pi - 10$ lie between $-\frac{\pi}{2}$ and $\frac{\pi}{2}$

Also, $\sin(3\pi - 10) = \sin 10$

$\therefore \quad \sin^{-1}(\sin 10) = \sin^{-1}(\sin(3\pi - 10)) = (3\pi - 10)$

(ii) We know that,

$\tan^{-1}(\tan\theta) = \theta$, if $-\pi/2 < \theta < \pi/2$. Here, $\theta = -6$, radians which does not lie between $-\pi/2$ and $\pi/2$. We find that $2\pi - 6$ lies between $-\pi/2$ and $\pi/2$ such that;

$\tan(2\pi - 6) = -\tan 6 = \tan(-6)$

$\therefore \quad \tan^{-1}(\tan(-6)) = \tan^{-1}(\tan(2\pi - 6)) = (2\pi - 6)$

(iii) $\cot^{-1}(\cot 4) = \cot^{-1}(\cot(\pi + (4 - \pi))) = \cot^{-1}(\cot(4 - \pi)) = (4 - \pi)$

Solution : We have $\tan^{-1} y = 4\tan^{-1} x$

$\Rightarrow \quad \tan^{-1} y = 2\tan^{-1}\frac{2x}{1-x^2}$ (as $|x| < 1$)

$$= \tan^{-1}\frac{\frac{4x}{1-x^2}}{1-\frac{4x^2}{(1-x^2)^2}} = \tan^{-1}\frac{4x(1-x^2)}{x^4-6x^2+1} \qquad \left(\text{as}\left|\frac{2x}{1-x^2}\right| < 1\right)$$

$\Rightarrow \quad y = \dfrac{4x(1-x^2)}{x^4-6x^2+1}$

If $x = \tan\frac{\pi}{8}$

$\Rightarrow \quad \tan^{-1} y = 4\tan^{-1} x = \frac{\pi}{2} \Rightarrow$ y is not defined $\Rightarrow x^4 - 6x^2 + 1 = 0$ **Ans.**

Illustration 24 : If $A = 2\tan^{-1}\left(2\sqrt{2}-1\right)$ and $B = 3\sin^{-1}(1/3) + \sin^{-1}(3/5)$, then show $A > B$.

Solution : We have, $A = 2\tan^{-1}\left(2\sqrt{2}-1\right) = 2\tan^{-1}(1.828)$

$\Rightarrow \quad A > 2\tan^{-1}\left(\sqrt{3}\right) \Rightarrow A > \frac{2\pi}{3}$ .... (i)

also we have, $\sin^{-1}\left(\frac{1}{3}\right) < \sin^{-1}\left(\frac{1}{2}\right) \Rightarrow \sin^{-1}\left(\frac{1}{3}\right) < \frac{\pi}{6}$

$\Rightarrow \quad 3\sin^{-1}\left(\frac{1}{3}\right) < \frac{\pi}{2}$

also, $3\sin^{-1}\left(\frac{1}{3}\right) = \sin^{-1}\left(3.\frac{1}{3} - 4\left(\frac{1}{3}\right)^3\right) = \sin^{-1}\left(\frac{23}{27}\right) = \sin^{-1}(0.852)$

$\Rightarrow \quad 3\sin^{-1}(1/3) < \sin^{-1}\left(\sqrt{3}/2\right) \Rightarrow 3\sin^{-1}(1/3) < \pi/3$

also, $\sin^{-1}(3/5) = \sin^{-1}(0.6) < \sin^{-1}\left(\sqrt{3}/2\right) \Rightarrow \sin^{-1}(3/5) < \pi/3$

Hence, $B = 3\sin^{-1}(1/3) + \sin^{-1}(3/5) < \frac{2\pi}{3}$ .... (ii)

From (i) and (ii), we have $A > B$.

Solution :

$$\theta = \tan^{-1}(2\tan^2\theta) - \frac{1}{2}\sin^{-1}\left(\frac{3\sin 2\theta}{5+4\cos 2\theta}\right) \Rightarrow \theta = \tan^{-1}(2\tan^2\theta) - \frac{1}{2}\sin^{-1}\left(\frac{6\tan\theta}{9+\tan^2\theta}\right)$$

$$\Rightarrow \theta = \tan^{-1}(2\tan^2\theta) - \frac{1}{2}\sin^{-1}\left[\frac{2\left(\frac{1}{3}\tan\theta\right)}{1+\left(\frac{1}{3}\tan\theta\right)^2}\right] \Rightarrow \theta = \tan^{-1}(2\tan^2\theta) - \frac{2}{2}\tan^{-1}\left(\frac{1}{3}\tan\theta\right)$$

$$\Rightarrow \quad \theta = \tan^{-1}(2\tan^2\theta) - \tan^{-1}\left(\frac{1}{3}\tan\theta\right) \qquad \text{........ (i)}$$

taking tangent on both sides

$$\Rightarrow \quad \tan\theta = \frac{6\tan^2\theta - \tan\theta}{3+2\tan^3\theta} \Rightarrow \quad 2\tan^4\theta - 6\tan^2\theta + 4\tan\theta = 0$$

$$\Rightarrow \quad 2\tan\theta(\tan^3\theta - 3\tan\theta + 2) = 0 \Rightarrow \quad 2\tan\theta(\tan\theta - 1)^2(\tan\theta + 2) = 0$$

$\Rightarrow \quad \tan\theta = 0, 1, -2$ which satisfy equation (i)
